ABSTRACT

Pedagogical conditions are conditions that ensure the effectiveness of the pedagogical system and the success of the pedagogical process. Pedagogical conditions mean a set of possibilities, methods, organizational forms and material possibilities of its implementation.

Keywords:

Pedagogical activity, conditions, terminological base, professional mobility, method, skills

Pedagogical conditions are conditions that ensure the effectiveness of the pedagogical system and the success of the pedagogical process. Pedagogical conditions are understood as a set of possibilities, methods, organizational forms of teaching content and material possibilities for its implementation, which ensure the success of achieving the set task.

Pedagogical conditions help or oppose the manifestation of pedagogical laws due to the influence of various factors. The possibility of managing the pedagogical process is realized by neutralizing negative factors and creating positive pedagogical conditions for the pedagogical process. The possibility of managing the pedagogical process is realized by neutralizing negative factors and creating positive pedagogical conditions for the pedagogical process.

A condition is a philosophical category that defines "something that depends on another condition". It constitutes the environment in which the studied phenomenon or process arises, exists and develops.

Pedagogical conditions are conditions defined by real rules in which intellectual development of students can be successfully carried out during the educational process of Higher Educational Institutions.

V. I. Andreev defined pedagogical conditions as "... the result of purposeful selection, design and application of content elements, methods (techniques), as well as organizational forms to achieve goals". In our research, pedagogical conditions are understood as external situations that have a noticeable effect on the progress of the pedagogical process, are consciously created by the teacher to a certain extent, and include the achievement of a certain result (N.M. Boritko).

This definition corresponds to the concept of "conditions" defined by I.F. Berezhnaya, in which conditions are considered as purposefully created situations.

Taking into account the expansion of the terminological base, the personal direction of students to acquire professional information; development of a system of step-by-step

formation of students' knowledge, skills and abilities in the process of mastering the terminology base; selection of real radio engineering texts for each stage of implementation of the didactic model of organizing the linguo-professional training of engineers;

We fully share these points and consider them fundamental to the study of pedagogical conditions for the development of readiness for professional mobility. The conditions that contribute to the more effective development of readiness for professional mobility are divided into the following:

- taking into account the individual level of development of students' readiness for professional mobility;

- taking into account the individual level of development of students' readiness for professional mobility;

- subject-subject relations between students and teachers;

- development of a model for the development of readiness for professional mobility, an appropriate complex program that includes individual and group forms and methods of organizing the educational process;

- involving students in various types of individual and group (the composition of which is variable) activities, during which the skills and abilities of preparation for professional mobility are improved;

- high level of preparation of the teacher included in the process of training future specialists (level of preparation of the teacher for his professional mobility);

- systematic diagnosis of the level of readiness for professional mobility of future specialists.

These conditions exist and are implemented both in the classroom and in extracurricular activities. The development of socio-humanitarian sciences, as well as economic sciences using foreign means, will have a particularly positive effect on the development of future specialists' readiness for professional mobility. This once again confirms the need for a comprehensive approach in the process of developing the readiness of a future specialist for professional mobility.

The following are the conditions that will help in the more effective development of preparation for professional mobility:

- *taking into account the individual level of development of students' readiness for professional mobility.*

It is important to emphasize the possibility of choosing the methods and means of learning a foreign language that are optimal for the independent work of a particular student. It is worth noting that this subject creates ample opportunities to take into account the individual educational interests of each student, to ensure interdisciplinary connection and continuity at all stages of teaching a foreign language to students, and to activate learning through the use of innovative pedagogical technologies in the educational process. It should be taken into account that each student has a different level of preparation for professional mobility. In addition, some students, and many of them, have low qualifications.

It depends on various factors that should be taken into account in further development of readiness for professional mobility. These factors include: the student's individual level of preparation for professional mobility, his individual and social experience, as well as individual characteristics. Taking into account these factors allows to more successfully determine the individual level of preparation for professional mobility of the student.

Language training allows you to quickly adapt to changing conditions and make decisions, to communicate with representatives of foreign companies and foreign language speakers without experiencing a "communication barrier" in the implementation of various interactions. At the same time, grammar, vocabulary and written practice serve as a means of forming students' active speech behavior. In the course of education, future professionals learn the technique of communication, its procedural aspect, the rules of speech etiquette, the strategy and tactics of dialogue and group communication.

A foreign language is of special importance in a number of other educational subjects, because the active methods used by it are aimed at combining learning and cognitive activity with other types of it - communication, play, economic and management practices, and create strong motivation, constructive professional behavior and lifestyle examples. allows to master. Students are offered tasks in the form of situations that require alternative solutions, development of readiness for professional mobility. In this case, the topic of special language courses is in demand, which is important in solving the problems of mobility development: "Professional development of a person from a foreign perspective", "Professional mobility in foreign countries" and others. Problematic professional foreign language tasks organize a problematic professional situation in linguo-didactic parameters and provide quick and effective student actions aimed at solving it.

And also, in the process of conducting foreign language classes, special methods, pedagogical technologies, focused lessons expand the vocabulary of professional mobility with the help of special texts, develop the skills of effective cooperation with representatives of other socio-cultural groups.

Thus, the possibilities of the subject "Foreign language" are very wide. Forms, methods and tools used in the process of teaching it allow to develop readiness for professional mobility. That is, the uniqueness of the content of science - its variability plays a positive role. The used educational material is mobile, it can be changed taking into account the changes taking place in society, personal interests of students, lesson forms, etc. Didactic possibilities of the subject "Foreign language" are required to develop readiness for professional mobility.
