ABSTRACT

The article "Developing Competence in Sorting Children into Sports Using Technology" focuses on the use of technology to improve the process of sorting children into different sports. The article discusses the challenges faced by physical education teachers in accurately identifying a child's potential in a particular sport and proposes the use of technology-based assessment tools as a solution. The article provides an overview of various technology-based assessment tools that can be used, including video analysis, wearable sensors, and machine learning algorithms. The effectiveness of these tools is discussed, along with their potential benefits and limitations. The article concludes by emphasizing the importance of integrating technology-based assessment tools into the process of sorting children into sports to ensure a more accurate and effective selection process.

Keywords:

competence development, sorting children into sports technology-based assessment tools, physical education, potential identification, video analysis, wearable sensors, machine learning algorithms, accuracy and effectiveness, selection process

Introduction: Sorting children into sports can be a challenging task for physical education teachers, as it requires the identification of a child's potential in a particular sport. Traditional methods of assessment may not always be accurate, which can result in children being placed in sports that are not suitable for their abilities. In recent years, technology-based assessment tools have emerged as a potential solution to this problem. This article explores the use of technology-based assessment tools in developing competence in sorting children into sports.

Literature Review: Previous research has explored various methods of sorting children into sports, including physical testing, observation, and interviews. However, these methods have limitations, as they can be subjective and may not accurately assess a child's potential. Technology-based assessment

tools, such as video analysis and wearable sensors, have been introduced to improve the accuracy and effectiveness of the selection process. Machine learning algorithms have also been used to analyze large amounts of data collected through these tools, providing insights into a child's potential in a particular sport. Studies have shown promising results in the use of technology-based assessment tools, with increased accuracy in the selection process and improved development of competence in children. However, there is still a need for further research to explore the effectiveness of these tools in different sports and age groups.

Analysis and Results: Research has shown that technology-based assessment tools, such as video analysis and wearable sensors, can effectively identify and evaluate a child's potential in various sports. These tools provide objective and reliable data that can be used to

make informed decisions about a child's selection into a particular sport. Machine learning algorithms have also been shown to be effective in analyzing this data, providing insights into a child's strengths and weaknesses and helping coaches and trainers to tailor their training programs accordingly.

Studies have also demonstrated that the use of technology-based assessment tools can improve the development of competence in children. By providing feedback and tracking progress over time, these tools can help children to set goals and monitor their own progress, increasing their motivation and engagement in the sport. Additionally, the use of technology-based assessment tools can lead to more inclusive and diverse teams, as children who may have been overlooked in traditional selection processes are given an opportunity to showcase their skills.

Overall, the use of technology-based assessment tools shows great potential for improving the selection process and development of competence in children's sports. However, further research is needed to determine the most effective ways to implement these tools in different sports and age groups, and to ensure that they are accessible to all children regardless of socioeconomic status.

Conclusions: The article "Developing Competence in Sorting Children for Sports Disciplines Using Technology" suggests the importance of using modern technology to identify and develop children's potential in different sports disciplines. The authors explore various technological tools such as computer-based tests, motion analysis systems, and artificial intelligence to assess and analyze children's physical and cognitive abilities.
