## ABSTRACT

The development of the information society leads to a shift from a material civilization to an invisible civilization, which it would be correct to call an information civilization. Information civilization creates huge opportunities for society and the economy. Internet functions such as remote work, distance learning or tele-information have their own social and economic consequences.

## Keywords:

information society, cyberbullying, sexting, grooming

**Introduction.** Over the past two decades, there has been a surge in the use of the Internet in human life. Thanks to this constant development, Internet users can communicate with any part of the globe, shop online, use it as a learning tool, work remotely and conduct financial transactions. Unfortunately, the rapid development of the Internet has a detrimental effect on our lives, which leads to various phenomena such as cyberbullying, cyberporno, cybersuicide, Internet addiction, social isolation, cyber racism, etc. to fix and analyze all these social and psychological effects that appear in users in connection with the active use of the Internet.

It is an undeniable fact that both computers and the Internet have become one of the most important achievements of modern society. They bring their own revolution into a person's daily life (science, education, information, entertainment, etc.), eliminating distances and offering immediate and easy access to information and communication. Thanks to the constant development of new technologies, Internet users can communicate anywhere in the world, shop online, use it as an educational tool, work remotely and carry out financial

transactions with various services offered by banks.

The endless possibilities offered by the Internet can often lead to users abusing it or using it for malicious purposes against other users, organizations and government services. With the rapid spread and growth of the Internet, they have developed some social phenomena, such as cyberbullying, Internet pornography, grooming through social networks, cybersuicide, Internet addiction and social isolation, racism on the web. In addition, there is always a risk of using any kind of fraud on the part of so-called technology systems specialists who use the Internet as a means to commit illegal actions. Analysis and methodology of the literature. Man is often regarded as a "social being". Therefore, it is not surprising that the Internet is constantly turning from a simple tool for publishing information into a means of social interaction and participation. Social networks (1) are characterized as online services that allow people to create public profiles in an entrenched network system. In addition, users publish a list of other users with whom the connection is shared, as well as view and share their own connection lists and those created by others in the system. Social networks are a set of

interactions and relationships. The term is also used today to describe websites that allow users to share reviews, photos, and other information. The most famous of these sites are Facebook, Twitter, My Space, Skype, ooVoo, LinkedIn, Tumblr, YouTube, TripAdvisor. These websites are virtual communities where people can communicate and develop contacts through them.

A social network is a social structure consisting of a number of factors, such as individuals or organizations. On the Internet, social networks are a platform that is maintained to create social relationships between people, usually active members of a social network, with common interests or activities. The revolution in information and communication systems has led the world to an online era in which electronic media have become the main tool of work, information and education. However, it can also create various kinds of threats and be a tool for manipulation.

Nowadays, thanks to the Internet, we can get into a completely new world where you can get any information. The Internet can replace almost any other independent medium: from radio, through television to newspapers. The fact that the Internet is virtually unlimited makes it an unstructured and even chaotic environment.

The Internet offers a completely new experience that was previously unavailable, such as online gaming networks, in which thousands of people are involved in real time and with their mobile devices can be constantly online. The global network, as a kind of meta-environment, creates a new social structure, which is the "information society", also called the "network society", "media society" or the "third wave" in the literature on the topic and in popular science journalism. Common and basic Characteristic of all these terms is that the main way of transmission is not direct contact, but indirect, via the Internet and the media (Koczy, 2013: 81).

The development of the information society leads to the departure of the material civilization as we know it, to an invisible civilization, which should be accurately called the information civilization. The functions of

information societies mainly relate to the role of tele-informatics and the Internet as a means of multitasking. From the point of view of the economy and the demand of society, the Internet has many functions, including remote work, distance learning or tele-information. The development of the information society has led to an increase in anonymity and, consequently, has freed up the sphere of self-confidence or self-interest. Social connections nowadays are more and more often based on symbolism.

**Conclusion.** In conclusion, we can say that the benefits of the Internet are numerous and contribute to the progress and prosperity of people in all areas. It offers quick access to information and facilitates communication. Nevertheless, the Internet is provided in abundance and easily accessible, and the illogical use of the Internet makes it quite dangerous, especially for young users. For this reason, users should be aware and critical of the information transmitted on websites in order to ensure proper behavior and limit its excessive use. As a result, there will never be any effect that will endanger the personal well-being of users. In fact, logical use and maintaining balance is the key to maximizing the benefits of the internet.
